above, the DNA may be present within any of a variety of delivery systems known to those of ordinary skill in the art, including nucleic acid expression systems, bacteria and viral expression systems. Numerous gene delivery techniques are well known in the art, such as those described by Rolland, *Crit. Rev. Therap. Drug Carrier Systems* 15:143-198 (1998), and references cited therein. Appropriate nucleic acid expression systems contain the necessary DNA sequences for expression in the patient (such as a suitable promoter and terminating signal). Bacterial delivery systems involve the administration of a bacterium (such as *Bacillus-Calmette-Guerrin*) that expresses an immunogenic portion of the polypeptide on its cell surface or secretes such an epitope. In a preferred embodiment, the DNA may be introduced using a viral expression system (e.g., vaccinia or other pox virus, retrovirus, or adenovirus), which may involve the use of a non-pathogenic (defective), replication competent virus. Suitable systems are disclosed, for example, in Fisher-Hoch *et al.*, *Proc. Natl. Acad. Sci. USA* 86:317-321 (1989); Flexner *et al.*, *Ann. N.Y. Acad. Sci.* 569:86-103 (1989); Flexner *et al.*, *Vaccine* 8:17-21 (1990); U.S. Patent Nos. 4,603,112, 4,769,330, and 5,017,487; WO 89/01973; U.S. Patent No. 4,777,127; GB 2,200,651; EP 0,345,242; WO 91/02805; Berkner, *Biotechniques* 6:616-627 (1988); Rosenfeld *et al.*, *Science* 252:431-434 (1991); Kolls *et al.*, *Proc. Natl. Acad. Sci. USA* 91:215-219 (1994); Kass-Eisler *et al.*, *Proc. Natl. Acad. Sci. USA* 90:11498-11502 (1993); Guzman *et al.*, *Circulation* 88:2838-2848 (1993); and Guzman *et al.*, *Cir. Res.* 73:1202-1207 (1993). Techniques for incorporating DNA into such expression systems are well known to those of ordinary skill in the art. The DNA may also be "naked," as described, for example, in Ulmer *et al.*, *Science* 259:1745-1749 (1993) and reviewed by Cohen, *Science* 259:1691-1692 (1993). The uptake of naked DNA may be increased by coating the DNA onto biodegradable beads, which are efficiently transported into the cells. It will be apparent that a vaccine may comprise both a polynucleotide and a polypeptide component. Such vaccines may provide for an enhanced immune response.

It will be apparent that a vaccine may contain pharmaceutically acceptable salts of the polynucleotides and polypeptides provided herein. Such salts may be prepared from pharmaceutically acceptable non-toxic bases, including organic bases (e.g., salts of primary, secondary and tertiary amines and basic amino acids) and inorganic bases (e.g., sodium, potassium, lithium, ammonium, calcium and magnesium salts).

While any suitable carrier known to those of ordinary skill in the art may be employed in the vaccine compositions of this invention, the type of carrier will vary depending on the mode of administration. Compositions of the present invention may be

formulated for any appropriate manner of administration, including for example, topical, oral, nasal, intravenous, intracranial, intraperitoneal, subcutaneous or intramuscular administration. For parenteral administration, such as subcutaneous injection, the carrier preferably comprises water, saline, alcohol, a fat, a wax or a buffer. For oral administration, any of the above carriers or a solid carrier, such as mannitol, lactose, starch, magnesium stearate, sodium saccharine, talcum, cellulose, glucose, sucrose, and magnesium carbonate, may be employed. Biodegradable microspheres (e.g., polylactate polyglycolate) may also be employed as carriers for the pharmaceutical compositions of this invention. Suitable biodegradable microspheres are disclosed, for example, in U.S. Patent Nos. 4,897,268; 5,075,109; 5,928,647; 5,811,128; 5,820,883; 5,853,763; 5,814,344 and 5,942,252. One may also employ a carrier comprising the particulate-protein complexes described in U.S. Patent No. 5,928,647, which are capable of inducing a class I-restricted cytotoxic T lymphocyte responses in a host.

Such compositions may also comprise buffers (e.g., neutral buffered saline or phosphate buffered saline), carbohydrates (e.g., glucose, mannose, sucrose or dextrans), mannitol, proteins, polypeptides or amino acids such as glycine, antioxidants, bacteriostats, chelating agents such as EDTA or glutathione, adjuvants (e.g., aluminum hydroxide), solutes that render the formulation isotonic, hypotonic or weakly hypertonic with the blood of a recipient, suspending agents, thickening agents and/or preservatives. Alternatively, compositions of the present invention may be formulated as a lyophilizate. Compounds may also be encapsulated within liposomes using well known technology.

Any of a variety of immunostimulants may be employed in the vaccines of this invention. For example, an adjuvant may be included. Most adjuvants contain a substance designed to protect the antigen from rapid catabolism, such as aluminum hydroxide or mineral oil, and a stimulator of immune responses, such as lipid A, *Bortadella pertussis* or *Mycobacterium* species or *Mycobacterium* derived proteins. For example, delipidated, deglycolipidated *M. vaccae* ("pVac") can be used. In another embodiment, BCG is used as an adjuvant. In addition, the vaccine can be administered to a subject previously exposed to BCG. Suitable adjuvants are commercially available as, for example, Freund's Incomplete Adjuvant and Complete Adjuvant (Difco Laboratories, Detroit, MI); Merck Adjuvant 65 (Merck and Company, Inc., Rahway, NJ); AS-2 and derivatives thereof (SmithKline Beecham, Philadelphia, PA); CWS, TDM, Leif, aluminum salts such as aluminum hydroxide gel (alum) or aluminum phosphate; salts of calcium, iron or zinc; an insoluble suspension of acylated tyrosine; acylated sugars;

cationically or anionically derivatized polysaccharides; polyphosphazenes; biodegradable microspheres; monophosphoryl lipid A and quil A. Cytokines, such as GM-CSF or interleukin-2, -7, or -12, may also be used as adjuvants.

Within the vaccines provided herein, the adjuvant composition is preferably designed to induce an immune response predominantly of the Th1 type. High levels of Th1-type cytokines (*e.g.*, IFN-γ, TNFα, IL-2 and IL-12) tend to favor the induction of cell mediated immune responses to an administered antigen. In contrast, high levels of Th2-type cytokines (*e.g.*, IL-4, IL-5, IL-6 and IL-10) tend to favor the induction of humoral immune responses. Following application of a vaccine as provided herein, a patient will support an immune response that includes Th1- and Th2-type responses. Within a preferred embodiment, in which a response is predominantly Th1-type, the level of Th1-type cytokines will increase to a greater extent than the level of Th2-type cytokines. The levels of these cytokines may be readily assessed using standard assays. For a review of the families of cytokines, see Mosmann & Coffman, *Ann. Rev. Immunol.* 7:145-173 (1989).

Preferred adjuvants for use in eliciting a predominantly Th1-type response include, for example, a combination of monophosphoryl lipid A, preferably 3-de-O-acylated monophosphoryl lipid A (3D-MPL), together with an aluminum salt. MPL adjuvants are available from Corixa Corporation (Seattle, WA; *see* US Patent Nos. 4,436,727; 4,877,611; 4,866,034 and 4,912,094). CpG-containing oligonucleotides (in which the CpG dinucleotide is unmethylated) also induce a predominantly Th1 response. Such oligonucleotides are well known and are described, for example, in WO 96/02555, WO 99/33488 and U.S. Patent Nos. 6,008,200 and 5,856,462. Immunostimulatory DNA sequences are also described, for example, by Sato *et al.*, *Science* 273:352 (1996). Another preferred adjuvant comprises a saponin, such as Quil A, or derivatives thereof, including QS21 and QS7 (Aquila Biopharmaceuticals Inc., Framingham, MA); Escin; Digitonin; or *Gypsophila* or *Chenopodium quinoa* saponins . Other preferred formulations include more than one saponin in the adjuvant combinations of the present invention, for example combinations of at least two of the following group comprising QS21, QS7, Quil A, β-escin, or digitonin.

Alternatively the saponin formulations may be combined with vaccine vehicles composed of chitosan or other polycationic polymers, polylactide and polylactide-co-glycolide particles, poly-N-acetyl glucosamine-based polymer matrix,

particles composed of polysaccharides or chemically modified polysaccharides, liposomes and lipid-based particles, particles composed of glycerol monoesters, etc. The saponins may also be formulated in the presence of cholesterol to form particulate structures such as liposomes or ISCOMs. Furthermore, the saponins may be formulated together with a polyoxyethylene ether or ester, in either a non-particulate solution or suspension, or in a particulate structure such as a paucilamelar liposome or ISCOM. The saponins may also be formulated with excipients such as Carbopol® to increase viscosity, or may be formulated in a dry powder form with a powder excipient such as lactose.

In one preferred embodiment, the adjuvant system includes the combination of a monophosphoryl lipid A and a saponin derivative, such as the combination of QS21 and 3D-MPL.® adjuvant, as described in WO 94/00153, or a less reactogenic composition where the QS21 is quenched with cholesterol, as described in WO 96/33739. Other preferred formulations comprise an oil-in-water emulsion and tocopherol. Another particularly preferred adjuvant formulation employing QS21, 3D-MPL.® adjuvant and tocopherol in an oil-in-water emulsion is described in WO 95/17210.

Another enhanced adjuvant system involves the combination of a CpG-containing oligonucleotide and a saponin derivative particularly the combination of CpG and QS21 as disclosed in WO 00/09159. Preferably the formulation additionally comprises an oil in water emulsion and tocopherol.

Other preferred adjuvants include Montanide ISA 720 (Seppic, France), SAF (Chiron, California, United States), ISCOMS (CSL), MF-59 (Chiron), the SBAS series of adjuvants (*e.g.*, SBAS-2, AS2', AS2,'' SBAS-4, or SBAS6, available from SmithKline Beecham, Rixensart, Belgium), Detox (Corixa, Hamilton, MT), RC-529 (Corixa, Hamilton, MT) and other aminoalkyl glucosaminide 4-phosphates (AGPs), such as those described in pending U.S. Patent Application Serial Nos. 08/853,826 and 09/074,720, the disclosures of which are incorporated herein by reference in their entireties, and polyoxyethylene ether adjuvants such as those described in WO 99/52549A1.

Other preferred adjuvants include adjuvant molecules of the general formula (I): $HO(CH_2CH_2O)_n$-A-R,

wherein, n is 1-50, A is a bond or –C(O)-, R is C_{1-50} alkyl or Phenyl C_{1-50} alkyl.

One embodiment of the present invention consists of a vaccine formulation comprising a polyoxyethylene ether of general formula (I), wherein *n* is between 1 and 50, preferably 4-24, most preferably 9; the *R* component is C_{1-50}, preferably C_8-C_{20} alkyl

and most preferably C_{12} alkyl, and *A* is a bond. The concentration of the polyoxyethylene ethers should be in the range 0.1-20%, preferably from 0.1-10%, and most preferably in the range 0.1-1%. Preferred polyoxyethylene ethers are selected from the following group: polyoxyethylene-9-lauryl ether, polyoxyethylene-9-steoryl ether, polyoxyethylene-8-steoryl ether, polyoxyethylene-4-lauryl ether, polyoxyethylene-35-lauryl ether, and polyoxyethylene-23-lauryl ether. Polyoxyethylene ethers such as polyoxyethylene lauryl ether are described in the Merck index (12th edition: entry 7717). These adjuvant molecules are described in WO 99/52549.

The polyoxyethylene ether according to the general formula (I) above may, if desired, be combined with another adjuvant. For example, a preferred adjuvant combination is preferably with CpG as described in the pending UK patent application GB 9820956.2.

Any vaccine provided herein may be prepared using well known methods that result in a combination of antigen, immune response enhancer and a suitable carrier or excipient. The compositions described herein may be administered as part of a sustained release formulation (i.e., a formulation such as a capsule, sponge or gel (composed of polysaccharides, for example) that effects a slow release of compound following administration). Such formulations may generally be prepared using well known technology (*see, e.g.*, Coombes *et al.*, *Vaccine* 14:1429-1438 (1996)) and administered by, for example, oral, rectal or subcutaneous implantation, or by implantation at the desired target site. Sustained-release formulations may contain a polypeptide, polynucleotide or antibody dispersed in a carrier matrix and/or contained within a reservoir surrounded by a rate controlling membrane.

Carriers for use within such formulations are biocompatible, and may also be biodegradable; preferably the formulation provides a relatively constant level of active component release. Such carriers include microparticles of poly(lactide-co-glycolide), polyacrylate, latex, starch, cellulose, dextran and the like. Other delayed-release carriers include supramolecular biovectors, which comprise a non-liquid hydrophilic core (e.g., a cross-linked polysaccharide or oligosaccharide) and, optionally, an external layer comprising an amphiphilic compound, such as a phospholipid (*see, e.g.*, U.S. Patent No. 5,151,254 and PCT applications WO 94/20078, WO/94/23701 and WO 96/06638). The amount of active compound contained within a sustained release formulation depends upon the site of implantation, the rate and expected duration of release and the nature of the condition to be treated or prevented.

Any of a variety of delivery vehicles may be employed within pharmaceutical compositions and vaccines to facilitate production of an antigen-specific immune response that targets tumor cells. Delivery vehicles include antigen presenting cells (APCs), such as dendritic cells, macrophages, B cells, monocytes and other cells that may be engineered to be efficient APCs. Such cells may, but need not, be genetically modified to increase the capacity for presenting the antigen, to improve activation and/or maintenance of the T cell response, to have anti-tumor effects *per se* and/or to be immunologically compatible with the receiver (i.e., matched HLA haplotype). APCs may generally be isolated from any of a variety of biological fluids and organs, including tumor and peritumoral tissues, and may be autologous, allogeneic, syngeneic or xenogeneic cells.

Certain preferred embodiments of the present invention use dendritic cells or progenitors thereof as antigen-presenting cells. Dendritic cells are highly potent APCs (Banchereau & Steinman, *Nature* 392:245-251 (1998)) and have been shown to be effective as a physiological adjuvant for eliciting prophylactic or therapeutic antitumor immunity (*see* Timmerman & Levy, *Ann. Rev. Med.* 50:507-529 (1999)). In general, dendritic cells may be identified based on their typical shape (stellate *in situ*, with marked cytoplasmic processes (dendrites) visible *in vitro*), their ability to take up, process and present antigens with high efficiency and their ability to activate naïve T cell responses. Dendritic cells may, of course, be engineered to express specific cell-surface receptors or ligands that are not commonly found on dendritic cells *in vivo* or *ex vivo*, and such modified dendritic cells are contemplated by the present invention. As an alternative to dendritic cells, secreted vesicles antigen-loaded dendritic cells (called exosomes) may be used within a vaccine (*see* Zitvogel *et al.*, *Nature Med.* 4:594-600 (1998)).

Dendritic cells and progenitors may be obtained from peripheral blood, bone marrow, tumor-infiltrating cells, peritumoral tissues-infiltrating cells, lymph nodes, spleen, skin, umbilical cord blood or any other suitable tissue or fluid. For example, dendritic cells may be differentiated *ex vivo* by adding a combination of cytokines such as GM-CSF, IL-4, IL-13 and/or TNFα to cultures of monocytes harvested from peripheral blood. Alternatively, CD34 positive cells harvested from peripheral blood, umbilical cord blood or bone marrow may be differentiated into dendritic cells by adding to the culture medium combinations of GM-CSF, IL-3, TNFα, CD40 ligand, LPS, flt3 ligand and/or

other compound(s) that induce differentiation, maturation and proliferation of dendritic cells.

Dendritic cells are conveniently categorized as "immature" and "mature" cells, which allows a simple way to discriminate between two well characterized phenotypes. However, this nomenclature should not be construed to exclude all possible intermediate stages of differentiation. Immature dendritic cells are characterized as APC with a high capacity for antigen uptake and processing, which correlates with the high expression of Fcγ receptor and mannose receptor. The mature phenotype is typically characterized by a lower expression of these markers, but a high expression of cell surface molecules responsible for T cell activation such as class I and class II MHC, adhesion molecules (e.g., CD54 and CD11) and costimulatory molecules (e.g., CD40, CD80, CD86 and 4-1BB).

APCs may generally be transfected with a polynucleotide encoding a protein (or portion or other variant thereof) such that the polypeptide, or an immunogenic portion thereof, is expressed on the cell surface. Such transfection may take place *ex vivo*, and a composition or vaccine comprising such transfected cells may then be used for therapeutic purposes, as described herein. Alternatively, a gene delivery vehicle that targets a dendritic or other antigen presenting cell may be administered to a patient, resulting in transfection that occurs *in vivo*. *In vivo* and *ex vivo* transfection of dendritic cells, for example, may generally be performed using any methods known in the art, such as those described in WO 97/24447, or the gene gun approach described by Mahvi *et al.*, *Immunology and Cell Biology* 75:456-460 (1997). Antigen loading of dendritic cells may be achieved by incubating dendritic cells or progenitor cells with the polypeptide, DNA (naked or within a plasmid vector) or RNA; or with antigen-expressing recombinant bacterium or viruses (e.g., vaccinia, fowlpox, adenovirus or lentivirus vectors). Prior to loading, the polypeptide may be covalently conjugated to an immunological partner that provides T cell help (e.g., a carrier molecule). Alternatively, a dendritic cell may be pulsed with a non-conjugated immunological partner, separately or in the presence of the polypeptide.

Vaccines and pharmaceutical compositions may be presented in unit-dose or multi-dose containers, such as sealed ampoules or vials. Such containers are preferably hermetically sealed to preserve sterility of the formulation until use. In general, formulations may be stored as suspensions, solutions or emulsions in oily or

aqueous vehicles. Alternatively, a vaccine or pharmaceutical composition may be stored in a freeze-dried condition requiring only the addition of a sterile liquid carrier immediately prior to use.

DIAGNOSTIC KITS

The present invention further provides kits for use within any of the above diagnostic methods. Such kits typically comprise two or more components necessary for performing a diagnostic assay. Components may be compounds, reagents, containers and/or equipment. For example, one container within a kit may contain a monoclonal antibody or fragment thereof that specifically binds to a protein. Such antibodies or fragments may be provided attached to a support material, as described above. One or more additional containers may enclose elements, such as reagents or buffers, to be used in the assay. Such kits may also, or alternatively, contain a detection reagent as described above that contains a reporter group suitable for direct or indirect detection of antibody binding.

Alternatively, a kit may be designed to detect the level of mRNA encoding a protein in a biological sample. Such kits generally comprise at least one oligonucleotide probe or primer, as described above, that hybridizes to a polynucleotide encoding a protein. Such an oligonucleotide may be used, for example, within a PCR or hybridization assay. Additional components that may be present within such kits include a second oligonucleotide and/or a diagnostic reagent or container to facilitate the detection of a polynucleotide encoding a protein of the invention.

All publications and patent applications cited in this specification are herein incorporated by reference as if each individual publication or patent application were specifically and individually indicated to be incorporated by reference.

Although the foregoing invention has been described in some detail by way of illustration and example for purposes of clarity of understanding, it will be readily apparent to one of ordinary skill in the art in light of the teachings of this invention that certain changes and modifications may be made thereto without departing from the spirit or scope of the appended claims.

EXAMPLES

The following examples are provided by way of illustration only and not by way of limitation. Those of skill in the art will readily recognize a variety of noncritical parameters that could be changed or modified to yield essentially similar results.

Example 1: Guinea pig vaccination with MTB72F fusion protein and compositions with individual antigens

Guinea pigs were immunized with adjuvant alone (SBAS1, SBAS2, or ASAS7 plus Al(OH)3), MTB72F fusion protein in adjuvant, or TbH9 plus Ra35 antigen composition.

Methods:

Groups:
1) SBAS1
2) SBAS2
3) SBAS7 + Al(OH)3
4) TbH9+Ra35 + SBAS1
5) TbH9 + Ra35 + SBAS2
6) TbH9 + Ra35 + SBAS7(Al(OH)3)
7) MTB72F in SBAS1
8) MTB72F in SBAS2
9) MTB72F in SBAS7+Al(OH)3
10) PBS
11) BCG

Dosage: 4 μg each of TbH9 and Ra35
8 μg MTB72F

Protocol: 1st immunization, 2nd immunization approximately 3 weeks later, 3rd immunization approximately two and a half weeks later.

Pre-challenge: DTH (delayed type hypersensitivity, used to determine antigenicity; 10 μg antigen)

Challenge: Aerosol with ~30 cfu Erdman strain

Post challenge monitoring: Weight loss

Death (~6 months post challenge)

Results:

1. DTH

Positive reaction to the immunizing antigens. Reactions to individual antigens or the fusion protein were comparable. Skin test reactivity to PPD was only seen with the BCG immunized groups

2. Protection: Guinea pigs vaccinated with MTB72F fusion protein afforded protection compared to those immunized with a mixture of antigens (*see* Figure 1).

Example 2: Mouse vaccination with MTB72F fusion protein and compositions with individual antigens

As described above, mice were immunized with adjuvant alone (SBAS2, SBAS2', SBAS2'', or SBAS6), MTB72F fusion protein in adjuvant, MTB72F DNA, MTB59F fusion protein in adjuvant, or TbH9, Ra35 and Ra12 antigen composition.

Methods:

Groups:

1) MTB72F+ SBAS2
2) MTB72F + SBAS2'
3) MTB72F + SBAS2''
4) MTB72F + SBAS6
5) Ra12+ TbH9 + Ra35 in SBAS2
6) MTB59F in SBAS2
7) SBAS2
8) MTB72F + delipidated, deglycolipidated *M. vaccae*
9) MTB72F DNA
10) MTB72F +IFA
11) MTB72F + BCG

12) delipidated, deglycolipidated *M. vaccae*

13) BCG

14) Saline

15) MTB72F +SBAS2 (in house formulation)

8 animals per group

Immunization schedule: First immunization, second immunization approximately 3 weeks later; third immunization approximately three weeks later.

Aerosol challenge approximately three months after first does

Spleen or lung cells were isolated and cultured; count CFU of cultures approximately three weeks after plating.

Dose: 8 μg MTB72F, 6.56 μg MTB59F, or 1.52, 4.3, and 2.24 μg, respectively, of Ra12, TbH9, and Ra35, mixed.

Results:

Of the AS adjuvants, AS2" + MTB72F gave the best protection in both the spleen and lung in this set of experiments (*see* Figures 2A and 2B). MTB72F gave ~1 log better protection than MTB59F in both spleen and lung in this set of experiments, indicating that Ra12 provides additional benefit. Mixture of 12/H9/35 + AS2 gave a better protection than MTB72F in this experiment. MTB72F DNA gave the best protection in this experiment, particularly in the spleen (>2 log). The protection was comparable in the lung to that seen with MTB72F protein + AS2", in this experiment.

Example 3: Guinea pig vaccination with MTB72F fusion protein and compositions with individual antigens

As described above, guinea pigs were immunized with adjuvant alone (SBAS2, SBAS2', SBAS2'', or SBAS6), MTB72F fusion protein in adjuvant, MTB72F DNA, MTB59F fusion protein in adjuvant, or TbH9, Ra35 and Ra12 antigen composition.

Methods:

Groups: 1) MTB72F + SBAS2

2) MTB72F + SBAS2'

3) MTB72F + SBAS2''
4) MTB72F + SBAS6
5) Ra12+ TbH9 + Ra35 in SBAS2
6) MTB59F in SBAS2
7) SBAS2
8) MTB72F + pvac
9) MTB72F DNA
10) MTB72F +IFA
11) MTB72F + BCG
12) BCG
13) Saline
14) delipidated, deglycolipidated *M. vaccae*

Antigens:

Antigens were formulated on a molar equivalent

5 animals per group

Injection volume per dose is 250µl (IM) containing

MTB72F	20 µg
Ra12, TbH9, Ra35	3.8, 10.8, and 5.6 µg
MTB59F	16.4 µg

Schedule:

1st immunization, 2nd immunization approximately three weeks later, 3rd immunization approximately three weeks later.

Challenge: ~ one and one half months after first immunization.

Results:

~38 Wks post challenge

Groups	Alive	State
G1. MTB72F + AS2	1/5	[losing weight]

G2. MTB72F + AS2'	2/5	[not gaining weight]
G3. MTB72F + AS2"	3/5	[looking okay, but no weight gain]
G4. MTB72F + AS6	2/5	[both these gaining weight]
G5. MTBRa12+H9+Ra35 +AS2	4/5	[one maybe a bit peaked, but two gaining]
G6. MTB59F + AS2	2/5	[both losing a little]
G7. AS2	2/5	[both losing]
G8. MTB72F + pVac	1/5	[not looking too good]
G9. MTB72F DNA	3/5	[all holding steady]
G10. MTB72F + IFA	2/5	[doing okay]
G11. MTB72F + BCG	5/5	[eating very well]
G12 BCG	4/5	[doing fine]
G13 Saline	all dead	
G14 pVac	2/5	[not gaining weight]

By 50 weeks post challenge, while 80% (4/5) of the guinea pigs immunized with BCG + Mtb72F were still alive, only 20% (1/5) of those immunized with BCG alone were alive. At 85 weeks, 4/5 of the guinea pigs immunized with BCG + Mtb72F were still alive and healthy (*see* Figure 7).

Example 4: Long term protection

As described above, guinea pigs were immunized with adjuvant alone (AS2 or AS2''), MTB72F fusion protein in adjuvant, TbH9, Ra35 and Ra12 antigen composition, or a variety of individual antigens in adjuvant.

Methods

GROUPS	ANTIGEN DOSE
1. AS2" + MTB39 (TbH9)	20ug/250ul (IM)
2. AS2" + MTB8.4 (DPV)	20ug
3. AS2" + MTB9.9 (MTI)	20ug
4. AS2" + MTB41 (MTCC#2)	20ug
5. AS2" + MTB40 (HTCC#1)	20ug
6. AS2" + MTB9.8 (MSL)	20ug
7. AS2" + MTB72F	20ug

8. AS2" + Ra12+TbH9 + Ra35 (molar equivalent) 3.8 μg +10.8 μg +5.6 μg
9. AS2" + MTB71F + MTB72F+HTCC#1 20 μg +20 μg +10 μg
10. AS2" + Ra12 20 μg
11. BCG
12. AS2"
13. AS2 + MTB72F
14. AS2+ Ra12+TbH9+Ra35
15. AS2

Example 5: Monkey vaccination with MTB72F fusion protein and compositions with individual antigens

As described above, monkeys were immunized with MTB72F fusion protein in SBAS2 adjuvant, or MTB8.4 antigen composition in adjuvant, or a mixture of MTB72F and MTB8.4.

Methods:

Groups

1. Saline
2. BCG
3. MTB8.4/AS2
4. MTB72F/AS2
5. MTB72F/AS2 (one arm) + MTB8.4/AS2 (other arm)

40 μg each antigen

Results:

At 8 weeks post challenge, monkeys immunized with BCG are showing signs of infection

Current data for 16 weeks post challenge reveals the following trend:

Groups immunized with MTB72F (4 and 5) are holding on their weights and have low ESR values compared to group 3 (MTB8.4 immunization) (Tables 1 and 2).

Table 1

Prophylactic Vaccine Study in Cynomolgus Monkeys with MTB8.4 and MTB72F formulated in AS2 20 Weeks Post Challenge

Groups	ID	Net weight Change (kg)	Chest X-ray (onset)	Status
	1398K	-24%	Pn, bil, prog (wk 8)	Alive
AS2	4437B	-33%	Pn, bil, prog (wk4)	Dead

Example 6: BCG priming experiment in monkeys

5 animals per group with four groups immunized with BCG and then rested, then immunized as described above and challenged. The following protocol will be used:

Groups	# animals	Immunizing Antigen	Antigen Dose
1. Nothing	5	AS2	
2. BCG	5	AS2	
3. BCG	5	MTB72F	40ug
4. BCG	4	Ra12+TbH9+Ra35	Molar equiv of antigens in MTB72F dose
5. BCG	4	MTB72F + MTB71F + MTB40	40ug MTB72F 40ug MTB72F 20ug MTB40

All antigens in formulated in AS2

Groups 4 and 5 have four animals each. Two of the BCG immunized monkeys died

Groups	# animals	Immunizing Antigen	Antigens for T cell proliferation and cytokine production assays
1. Nothing	5	AS2	PHA, PPD, MTB72F, MTB71F, HTCC#1, DPV, MTCC#2, Ra12, TbH9, Ra35, MSL, MTI
2. BCG	5	AS2	PHA, PPD, MTB72F, MTB71F, HTCC#1, DPV, MTCC#2, Ra12, TbH9, Ra35, MSL, MTI
3. BCG	5	MTB72F	PHA, PPD, MTB72F, Ra12, TbH9, Ra35
4. BCG	4	Ra12+TbH9+Ra35	PHA, PPD, MTB72F, Ra12, TbH9, Ra35
5. BCG	4	MTB72F + MTB71F + MTB40	PHA, PPD, MTB72F, MTB71F, HTCC#1, DPV, MTCC-2, Ra12, TbH9, Ra35, MSL, MTI

Example 7: Construction of Ra35MutSA and MTB72FMutSA

Expression of Mtb72f typically results in some breakdown products. In addition, the expression of the full-length sequences of the mature or full length form of Ra35 (Mtb32A) in *E. coli* has been difficult. The expressed product was only visible after immunoblotting with a polyclonal rabbit anti-Ra35 Ab indicative of low levels of protein expression. Even then, multiple specific species (bands) were detected indicative of auto-catalytic breakdown (degradation) of the recombinant antigen. This was presumed to be due to the expression of Ra35FL in *E. coli* as a biologically active form.

It has been previously shown that it was possible to express Ra35FL as two overlapping halves comprising the N-terminal (Ra35N-term, called Ra35) and C-term halves (Ra35C-term called Ra12). To enhance and stabilize the expression of the whole Ra35 molecule, a single point mutation was introduced at one of the residues

within the active-site triad (substitution of Ser to Ala; *see* Figures 6). This mutagenized form of Mtb32A can now be easily expressed at high levels in a stable form. In addition, to stabilize expression of Mtb72F, a single nucleotide substitution (T to G, resulting in a Ser to Ala change at position 710 of the fusion polypeptide) was incorporated in the sequence of Mtb72F at nucleotide position 2128 (*see* Figure 5).

This stabilization is also readily accomplished by mutagenizing any one, any two, or all three of the three residues comprising the active site triad in Ra35FL, Ra35, or Mtb72F or other fusion proteins comprising Ra35 (His, Asp, or Ser). Mutagenesis can be performed using any technique known to one of skill in the art.

Example 8: Immunization of mice withf Ra35FLMutSA-TbH9 and MTB72FMutSA

Eight mice per group were immunized with the compositions listed below, which include the adjuvant AS2A. The mice were then challenged with *Mycobacterium tuberculosis*, and survival of the mice was measured.

Group	Concentration of protein or DNA
1. Mtb72f protein	1.5 mg/ml
2. Mtb72f DNA	1.2 mg/ml
3. Mtb72f-85b protein	0.6 mg/ml
4. Mtb72f-85b DNA	1.1 mg/ml
5. Mtb72f-MTI protein	1.3 mg/ml
6. Mtb72f-MTI DNA	1.1 mg/ml
7. Mtb72f MutSA protein	1.7 mg/ml
8. MTB32AMutSA-TbH9 protein	2.4 mg/ml
9. BCG	
10. AS2	
11. vector alone	1.5 mg/ml
12. saline	

WHAT IS CLAIMED IS

1. A composition comprising a MTB39 antigen (SEQ ID NO:12 or 14) or an immunogenic fragment thereof from a *Mycobacterium* species of the tuberculosis complex, and a MTB32A antigen (SEQ ID NO:2 or 4) or an immunogenic fragment thereof from a *Mycobacterium* species of the tuberculosis complex.

2. The composition of claim 1, comprising a MTB39 antigen (SEQ ID NO:12 or 14) or an immunogenic fragment thereof from a *Mycobacterium* species of the tuberculosis complex, and a polypeptide comprising at least 195 amino acids from the N-terminus of a MTB32A antigen (SEQ ID NO:2 or 4) from a *Mycobacterium* species of the tuberculosis complex.

3. The composition of claim 2, further comprising a polypeptide comprising at least about 132 amino acids from the C-terminus of MTB32A antigen (SEQ ID NO:2 or 4) from a *Mycobacterium* species of the tuberculosis complex.

4. The composition of claims 1, 2, or 3, wherein the antigens are covalently linked, thereby forming a fusion polypeptide.

5. The composition of claim 4, wherein the fusion polypeptide has the amino acid sequence of MTB59F (SEQ ID NO:20).

6. The composition of claim 4, wherein the fusion polypeptide has the amino acid sequence of MTB72F (SEQ ID NO:16).

7. The composition of claim 4, wherein the fusion polypeptide has the amino acid sequence of MTB72FMutSA (SEQ ID NO:18).

8. The composition of claim 6 or 7, further comprising BCG.

9. The composition of claim 6 or 7, further comprising at least one additional antigen from a *Mycobacterium* species of the tuberculosis complex, wherein the antigen is selected from the group consisting of MTB8.4 antigen (SEQ ID NO:22), MTB9.8 antigen (SEQ ID NO:24), MTB9.9 antigen (SEQ ID NO:27), MTB40 antigen (SEQ ID NO:29), MTB41 antigen (SEQ ID NO:31), 38-1 (SEQ ID NO:35), TbRa3 (SEQ ID NO:37), 38 kD (SEQ ID NO:39), DPEP (SEQ ID NO:41), TbH4 (SEQ ID NO:43),

DPPD(SEQ ID NO:45), MTB82, Erd14, ESAT-6 antigen (SEQ ID NO:33), MTB85 complex antigen, or α-crystalline antigen, or an immunogenic fragment thereof.

10. The composition of claim 6 or 7, further comprising an adjuvant.

11. The composition of claim 4, wherein the antigens are covalently linked via a chemical linker.

12. The composition of claim 11, wherein the chemical linker is an amino acid linker.

13. The composition of claim 1, further comprising at least one additional antigen from a *Mycobacterium* species of the tuberculosis complex, wherein the antigen is selected from the group consisting ofMTB8.4 antigen (SEQ ID NO:22), MTB9.8 antigen (SEQ ID NO:24), MTB9.9 antigen (SEQ ID NO:27), MTB40 antigen (SEQ ID NO:29), MTB41 antigen (SEQ ID NO:31), 38-1 (SEQ ID NO:35), TbRa3 (SEQ ID NO:37), 38 kD (SEQ ID NO:39), DPEP (SEQ ID NO:41), TbH4 (SEQ ID NO:43), DPPD(SEQ ID NO:45), MTB82, Erd14, ESAT-6 antigen (SEQ ID NO:33), MTB85 complex antigen, or α-crystalline antigen, or an immunogenic fragment thereof.

14. The composition of claim 1, further comprising an adjuvant.

15. The composition of claim 14, wherein the adjuvant comprises QS21 and MPL.

16. The composition of claim 14, wherein the adjuvant is selected from the group consisting of AS2, ENHANZYN, MPL, 3D-MPL, IFA, QS21, CWS, TDM, AGP, CPG, Leif, saponin, and saponin mimetics.

17. The composition of claim 1, further comprising BCG or pVac.

18. The composition of claim 1, further comprising an NS1 antigen or an immunogenic fragment thereof.

19. The composition of claim 1, wherein the *Mycobacterium* species is *Mycobacterium tuberculosis*.

20. An expression cassette comprising a nucleic acid encoding a MTB39 antigen (SEQ ID NO:12 or 14) or an immunogenic fragment thereof from a *Mycobacterium* species of the tuberculosis complex, and a nucleic acid encoding a MTB32A antigen (SEQ ID NO:2 or 4) or an immunogenic fragment thereof from a *Mycobacterium* species of the tuberculosis complex.

21. The expression cassette of claim 20, comprising a nucleic acid encoding a MTB39 antigen (SEQ ID NO:12 or 14) or an immunogenic fragment thereof from a *Mycobacterium* species of the tuberculosis complex, and a nucleic acid encoding a polypeptide comprising at least 195 amino acids from the N-terminus of a MTB32A antigen (SEQ ID NO: 2 or 4) from a *Mycobacterium* species of the tuberculosis complex.

22. The expression cassette of claim 21, further comprising a nucleic acid encoding a polypeptide comprising at least 132 amino acids of the C-terminus of a MTB32A antigen (SEQ ID NO:2 or 4) from a *Mycobacterium* species of the tuberculosis complex.

23. The expression cassette of claim 20, wherein the nucleic acid encodes a fusion polypeptide comprising a MTB39 antigen (SEQ ID NO:12 or 14) or an immunogenic fragment thereof and a nucleic acid encoding a MTB32A antigen (SEQ ID NO:2 or 4) or an immunogenic fragment thereof.

24. The expression cassette of claim 23, wherein the nucleic acid encodes a fusion polypeptide comprising a MTB39 antigen (SEQ ID NO:12 or 14) or an immunogenic fragment thereof, and a polypeptide comprising at least 195 amino acids from the N-terminus of a MTB32A antigen (SEQ ID NO:2 or 4).

25. The expression cassette of claim 24, wherein the fusion polypeptide further comprises a polypeptide comprising at least 132 amino acids of the C-terminus of a MTB32A antigen (SEQ ID NO:2 or 4).

26. The expression cassette of claim 24, wherein the nucleic acid encodes a fusion polypeptide having the amino acid sequence of MTB59F (SEQ ID NO:20).

27. The expression cassette of claim 26, wherein the nucleic acid has the sequence of the nucleic acid encoding MTB59F (SEQ ID NO:19).

28. The expression cassette of claim 25, wherein the nucleic acid encodes a fusion polypeptide having the amino acid sequence of MTB72F (SEQ ID NO:16).

29. The expression cassette of claim 28, wherein the nucleic acid has the sequence of the nucleic acid encoding MTB72F (SEQ ID NO:15).

30. The expression cassette of claim 28, wherein the nucleic acid has the sequence of the nucleic acid encoding MTB72FMutSA (SEQ ID NO:18).

31. The expression cassette of claim 29or 30, further comprising a nucleic acid encoding at least one additional antigen from a *Mycobacterium* species of the tuberculosis complex, wherein the antigen is selected from the group consisting ofMTB8.4 antigen (SEQ ID NO:22), MTB9.8 antigen (SEQ ID NO:24), MTB9.9 antigen (SEQ ID NO:27), MTB40 antigen (SEQ ID NO:29), MTB41 antigen (SEQ ID NO:31), 38-1 (SEQ ID NO:35), TbRa3 (SEQ ID NO:37), 38 kD (SEQ ID NO:39), DPEP (SEQ ID NO:41), TbH4 (SEQ ID NO:43), DPPD(SEQ ID NO:45), MTB82, Erd14, ESAT-6 antigen (SEQ ID NO:33), MTB85 complex antigen, or α-crystalline antigen, or an immunogenic fragment thereof.

32. The expression cassette of claim 20, further comprising a nucleic acid encoding at least one additional antigen from a *Mycobacterium* species of the tuberculosis complex, wherein the antigen is selected from the group consisting ofMTB8.4 antigen (SEQ ID NO:22), MTB9.8 antigen (SEQ ID NO:24), MTB9.9 antigen (SEQ ID NO:27), MTB40 antigen (SEQ ID NO:29), MTB41 antigen (SEQ ID NO:31), 38-1 (SEQ ID NO:35), TbRa3 (SEQ ID NO:37), 38 kD (SEQ ID NO:39), DPEP (SEQ ID NO:41), TbH4 (SEQ ID NO:43), DPPD(SEQ ID NO:45), MTB82, Erd14, ESAT-6 antigen (SEQ ID NO:33), MTB85 complex antigen, or α-crystalline antigen, or an immunogenic fragment thereof.

33. The expression cassette of claim 20, further comprising a nucleic acid encoding an NS1 antigen.

34. The expression cassette of claim 20, wherein the *Mycobacterium* species is *Mycobacterium tuberculosis*.

35. A method for eliciting an immune response in a mammal, the method comprising the step of administering to the mammal an immunologically effective amount of a pharmaceutical composition comprising a MTB39 antigen (SEQ ID NO:12 or 14) or an immunogenic fragment thereof from a *Mycobacterium* species of the tuberculosis complex, and a MTB32A antigen (SEQ ID NO:2 or 4) or an immunogenic fragment thereof from a *Mycobacterium* species of the tuberculosis complex.

36. The method of claim 35, wherein the mammal has been immunized with BCG.

37. The method of claim 35, wherein the mammal is a human.

38. The method of claim 35, wherein the composition is administered prophylactically.

39. The method of claim 35, comprising a MTB39 antigen (SEQ ID NO:12 or 14) or an immunogenic fragment thereof from a *Mycobacterium* species of the tuberculosis complex, and a polypeptide comprising at least 195 amino acids from the N-terminus of a MTB32A antigen (SEQ ID NO:2 or 4) from a *Mycobacterium* species of the tuberculosis complex.

40. The method of claim 39, further comprising a polypeptide comprising at least about 132 amino acids from the C-terminus of MTB32A antigen (SEQ ID NO: 2 or 4) from a *Mycobacterium* species of the tuberculosis complex.

41. The method of claim 35 or 39, wherein the antigens are covalently linked, thereby forming a fusion protein.

42. The method of claim 41, wherein the fusion polypeptide has the amino acid sequence of MTB59F (SEQ ID NO:20).

43. The method of claim 40, wherein the antigens are covalently linked, thereby forming a fusion protein.

44. The method of claim 43, wherein the fusion polypeptide has the amino acid sequence of MTB72F (SEQ ID NO:16).

45. The method of claim 43, wherein the fusion polypeptide has the amino acid sequence of MTB72FMutSA (SEQ ID NO:18).

46. The method of claim 35, wherein the pharmaceutical composition further comprises an adjuvant.

47. The method of claim 46, wherein the adjuvant comprises QS21 and MPL.

48. The method of claim 46, wherein the adjuvant is selected from the group consisting of AS2, ENHANZYN, MPL, 3D-MPL, IFA, QS21, CWS, TDM, AGP, CPG, Leif, saponin, and saponin mimetics.

49. A method for eliciting an immune response in a mammal, the method comprising the step of administering to the mammal an immunologically effective amount of an expression cassette comprising a nucleic acid encoding a MTB39 antigen (SEQ ID NO:12 or 14) or an immunogenic fragment thereof from a *Mycobacterium* species of the tuberculosis complex, and a nucleic acid encoding a MTB32A antigen (SEQ ID NO:2 or 4) or an immunogenic fragment thereof from a *Mycobacterium* species of the tuberculosis complex.

50. The method of claim 49, wherein the mammal has been immunized with BCG.

51. The method of claim 49, wherein the mammal is a human.

52. The method of claim 49, wherein the composition is administered prophylactically.

53. The method of claim 49, wherein the nucleic acid encodes a fusion polypeptide comprising a MTB39 antigen (SEQ ID NO:12 or 14) or an immunogenic fragment thereof, and a polypeptide comprising at least 195 amino acids from the N-terminus of a MTB32A antigen (SEQ ID NO:2 or 4) .

54. The method of claim 53, further comprising a nucleic acid encoding a polypeptide comprising at least 132 amino acids of the C-terminus of a MTB32A antigen (SEQ ID NO:2 or 4) from a *Mycobacterium* species of the tuberculosis complex.

55. The method of claim 49, wherein the nucleic acid encodes a fusion polypeptide comprising a MTB39 antigen (SEQ ID NO: 12 or 14) or an immunogenic fragment thereof and a nucleic acid encoding a MTB32A antigen (SEQ ID NO:2 or 4) or an immunogenic fragment thereof.

56. The method of claim 55, wherein the nucleic acid encodes a fusion polypeptide comprising a MTB39 antigen (SEQ ID NO:12 or 14) or an immunogenic fragment thereof, and a polypeptide comprising at least 195 amino acids from the N-terminus of a MTB32A antigen (SEQ ID NO: 2 or 4).

57. The method of claim 56, wherein the fusion polypeptide further comprises a polypeptide comprising at least 132 amino acids of the C-terminus of a MTB32A antigen (SEQ ID NO:2 or 4).

58. The method of claim 56, wherein the nucleic acid encodes a fusion polypeptide having the amino acid sequence of MTB59F (SEQ ID NO:20).

59. The method of claim 58, wherein the nucleic acid has the nucleotide sequence of the nucleic acid encoding MTB59F (SEQ IDNO:19).

60. The method of claim 57, wherein the nucleic acid encodes a fusion polypeptide having the amino acid sequence of MTB72F (SEQ ID NO:16) .

61. The method of claim 57, wherein the nucleic acid encodes a fusion polypeptide having the amino acid sequence of MTB72FMutSA (SEQ ID NO:18).

62. The method of claim 60, wherein the nucleic acid has the nucleotide sequence of the nucleic acid encoding MTB72F (SEQ IDNO:15).

63. The method of claim 60, wherein the nucleic acid has the nucleotide sequence of the nucleic acid encoding MTB72FMutSA (SEQ ID NO:17).

64. An isolated nucleic acid encoding a MTB32A antigen from a *Mycobacterium* species of the tuberculosis complex, wherein at least one amino acid in the active site triad of the MTB32A antigen (SEQ ID NO:2 or 4) has been substituted by a different amino acid.

65. The nucleic acid of claim 64, wherein an serine residue corresponding to amino acid position 183 of SEQ ID NO:4 or position 207 of SEQ ID NO:2 has been substituted by another amino acid.

66. The nucleic acid of claim 65, wherein an alanine residue has been substituted for the serine residue.

67. The nucleic acid of claim 66, wherein the nucleic acid comprises a nucleotide sequence of SEQ ID NO:5.

68. A composition comprising the nucleic acid of claim 64.

69. A nucleic acid encoding a fusion polypeptide comprising the nucleic acid of claim 64.

70. An isolated MTB32A polypeptide from a *Mycobacterium* species of the tuberculosis complex, wherein at least one amino acid in the active site triad of the MTB32A antigen (SEQ ID NO:2 or 4) has been substituted by a different amino acid.

71. The polypeptide of claim 70, wherein a serine residue corresponding to amino acid position 183 of SEQ ID NO:4 or amino acid position 207 of SEQ ID NO:2 has been substituted by another amino acid.

72. The polypeptide of claim 71, wherein an alanine residue has been substituted for the serine residue.

73. A polypeptide of claim 72, wherein the polypeptide comprises an amino acid sequence of SEQ ID NO:6.

74. A composition comprising the polypeptide of claim 70.

75. A fusion polypeptide comprising the polypeptide of claim 70.

76. An isolated nucleic acid encoding a fusion polypeptide comprising a MTB39 antigen (SEQ ID NO:12 or 14) from a *Mycobacterium* species of the tuberculosis complex, and an antigen comprising at least 195 amino acids from the N-terminus of a MTB32A antigen (SEQ ID NO:2 or 4) from a *Mycobacterium* species of the tuberculosis complex, wherein an amino acid of the active site triad of the MTB32A antigen (SEQ ID NO:2 or 4) has been substituted by a different amino acid.

77. The nucleic acid of claim 76, wherein a serine residue corresponding to amino acid at position 183 of SEQ ID NO:4 or position 207 or SEQ ID NO:2 has been substituted by another amino acid.

78. The nucleic acid of claim 77, wherein an alanine residue has been substituted for the serine residue.

79. A composition comprising the nucleic acid of claim 76.

80. A nucleic acid encoding a fusion polypeptide comprising the nucleic acid of claim 76.

81. A nucleic acid encoding a fusion polypeptide, wherein the nucleic acid comprises a nucleotide sequence of SEQ ID NO:17.

82. A nucleic acid encoding a fusion polypeptide comprising an amino acid sequence of SEQ ID NO:18.

83. An isolated polypeptide encoding a fusion polypeptide comprising a MTB39 (SEQ ID NO: 12 or 14) antigen from a *Mycobacterium* species of the tuberculosis complex, and an antigen comprising at least 195 amino acids from the N-terminus of a MTB32A antigen (SEQ ID NO:2 or 4) from a *Mycobacterium* species of the tuberculosis complex, wherein an amino acid of the active site triad of the MTB32A antigen (SEQ ID NO:2 or 4) has been substituted by a different amino acid.

84. The polypeptide of claim 83, wherein an serine residue corresponding to amino acid position 183 of SEQ ID NO:4 or amino acid position 207 of SEQ ID NO:2 has been substituted by another amino acid.

85. The polypeptide of claim 83, wherein an alanine residue has been substituted for the serine residue.

86. A composition comprising the polypeptide of claim 83.

87. A fusion polypeptide comprising the polypeptide of claim 83.

88. A fusion polypeptide comprising an amino acid sequence of SEQ ID NO:18.
